INTERNATIONAL FINE ARTS AND PRINTING CONFERENCE

ABOUT

Art and culture have always been one of the most significant components of the advancement of societies. Interpreting culture and art and transferring them to future generations can only be done through scientific activities. Thus, I am sure that we will be leaving a substantial mark on the future through this conference which brought us together today.

The IFAPC shows us how essential collaboration in fine arts and printing is. In this context, the conference offers opportunities for researchers in the fields of art, design and printing to share their findings with scientists, discuss theoretical and practical issues, and network with experts and distinguished participants who have important studies in these fields. At the same time, this conference will provide an environment for comprehensive artistic activities.

Within the scope of the conference, the first of the exhibitions to be organized is the jury-selected poster exhibition with the theme "I imagine...". The exhibition will be opened on February 2, 2023 and will be with art lovers for a week. I would like to thank those who supported us for the opening of this exhibition. In addition, group and solo exhibitions with the participation of hundreds of artists from different parts of the world will come together with all art and design lovers on online platforms.

In conclusion, I am confident that the conference will provide valuable insights and inspire new ideas to shape the future of fine arts and printing. I would like to thank all of you for your presence here and your contribution to these essential areas of human expression, and I hope that the number of such congresses and exhibitions will increase.

Prof. Dr. Naci AYDIN

Rector, İstanbul University-Cerrahpaşa

"I IMAGINE..."

The International Poster Design exhibition is also planned as an extension of the Conference to show and express creative thinking and idea at such an international conference. The Poster Exhibition will consist of 100 works in total. While some of the artists will be selected as invited by the world's respected poster designers, some will be selected due to the evaluation made by the jury members and open to everyone within the framework of the competition.

The world appears to be on the verge of a new era in terms of economic, social and political terms. Although this situation poses some threats (COVID-19 Outbreak, War, Economic Crisis and Effects), people communicate through information technologies, internet communication, and social media, which are positive developments in the name of dialogue and communication.

Problems such as hunger, famine, epidemic (COVID-19), migration, civil wars, occupations, and climate change threaten all countries and ultimately, humanity. We feel strongly as we feel all over the world that tensions in all fields sphere bring the world to the brink of new divisions and some new tensions.

For this reason, the task falls on the designers who have vision, dream and conscience. As designers, we believe that we can leave the world to future generations in every sense and continue a livable life. In this context, we want to express our dreams and the intellectuals that we foresee to be in our world under the title of "I Imagine..." with the language of visual design. With this exhibition, designers worldwide will express their most vital dreams and works with a visual manifesto in this exhibition to make a better world environment of happiness and life again. Now it's time to create and produce!

I IMAGINE

THE HUNGER PROBLEM IS COMPLETELY OVER!

According to a study conducted by the United Nations every year, more and more people in the world are getting rid of hunger every day. Millions of people have regular status in the different parts of the world, struggling with malnutrition.

According to the State of Food Security and Nutrition in the World, the last issue of which was published today, the number of people suffering from hunger decreased by 690 million in 2023, and it was completely over. The number of people suffering from hunger has decreased by 10 million compared to 2022, and by 60 million compared to the previous 5 years. Lower costs and higher purchasing power are making it easier for billions to access healthy and nutritious meals. 10 years ago, the most hungry people were found in Asia, but hunger was spreading the fastest in Africa. Today, however, Africa is among the top two regions that provide the most food aid.

The State of Food Security and Nutrition in the World report is the world's most trusted global study that closely monitors progress towards the goal of ending hunger and malnutrition. It is prepared in partnership with the Food and Agriculture Organization of the United Nations, the International Fund for Agricultural Development (IFAD), the United Nations Children's Fund (UNICEF), the UN World Food Programme (WFP) and the World Health Organization (WHO).

Executives of the five organizations mentioned above said in the foreword of the report: "It has been five years since the world committed to ending hunger, food insecurity and malnutrition. At the point we have reached so far, we have reached our goal and exceeded it".

AFRICA HAS STARTED GIVING SURPLUS FOODS TO OTHER COUNTRIES!

Things seem to have changed in the African continent, which has been wrecked by hunger and misery for many years. Another situation in which many events in the world started a chain reaction was that Africa got rid of hunger. After the end of hunger in the African continent, stocks in the country were evaluated. This situation was evaluated by the Member States in the African continent. The fact that the African continent had increased and increased the continent into a different place. Crime rates decreased by 99%. Literacy increased by 50% compared to the previous year. People of all ages took to the streets to read by applying to special units. It seems that there will be no illiterate people on the African continent in 2025.

EMPTY PRISONS ARE ALSO BEING REBUILT AS SHELTERS FOR ANIMALS

The crime rates have decreased by 99% in the last 3 years with the complete increase in world welfare, the increase in abundance, the end of wars and the acceptance of peace. Those who are currently in prison were allowed to work in the country of their choice according to the agreement between countries, and were released on a fixed monthly salary. Thousands of prisons were empty and the authorities made various projects to reuse these facilities. The most beautiful of these projects has begun to be transformed into animal habitats, which include a health area, natural habitat, and special food production facilities for street animals.

ALL INDUSTRIAL COMPANIES SWITCHED TO FULLY RENEWABLE ENERGY USE

With the announcement made in the United Nations board, the energy use narrative agreed before was fully complied with and all industrial companies in the world switched to renewable energy use. Thus, the use of underground fossil energy sources and nuclear energy is completely over. It's time for our world to breathe a sigh of relief. If we talk about renewable energy; it is the energy that can be obtained from carbon neutral natural sources such as sunlight, wind, rain, tides, waves and geothermal heat and is available from sources that are naturally replenished over the human time scale. These resources can be listed as solar energy, wind energy, wave energy, geothermal energy, hydropower, biomass energy. This type of energy source is the opposite of fossil fuels, which are used much faster than they are being regenerated. World-wide investments in renewable technologies exceeded US\$286 billion in 2015. Renewable energy systems are rapidly becoming more efficient and cheaper, and their share in total energy consumption is increasing. As of 2019, more than two-thirds of newly installed electricity capacity worldwide was renewable. The rapid expansion of renewable energy is driving innovation and economic growth, and will help to achieve the goals of the Paris Agreement on climate change and the Sustainable Development Goals.

THE GLOBAL DRINKING WATER PROBLEM IS OVER!

In the end, changing the face of this crisis involves education to motivate new behaviors. Coping with the coming era of water scarcity will require major overhaul of all forms of consumption, from individual use to the supply chains of major corporations, like GE. Some regions led by India, Australia and the Southwest U.S., are already facing the freshwater crisis. The most critical task is making sure the problem is much better understood worldwide. In areas where aquifers are drying up and rainwater is increasingly unpredictable, innovation is needed. But as we attempt to cope with freshwater scarcity and develop conservation technologies, energy consumption is an important consideration.

In March, World Water Day panelists urged a new mindset for wastewater treatment. Some countries, like Singapore, are trying to recycle to cut water imports and become more self-sufficient. The rich East Asian republic is a leader in developing advanced technology that cleanses wastewater for other uses, including drinking.

Some 70 percent of the world's freshwater is used for agriculture. Improving irrigation can help close supply and demand gaps. In certain cases profligate irrigation practices meant for an earlier era has weakened the ability of farmers to provide food and fiber to a growing world. Examples include the Murray-Darling basin in Australia, Central Asia's Aral Sea, and the American Southwest. Although new technology has become an appealing solution, global water experts like Peter Gleick note that in some cases, such as the agricultural systems in California, success stories can happen by improving what's already in place.

To date, desalination has been an energy-intensive solution to water scarcity. Typically the Middle East has capitalized on its large energy reserves to build desalination plants. But Saudi Arabia is fostering a new kind of desalination with its recent announcement to build a solar-powered plant. Britain is taking a different approach with small-scale facilities for agriculture. But these innovations bring to light another needed experiment: applying, simply put, holistic management approaches to overseeing natural resources that takes account economic, cultural, and ecological goals. In essence, the whole is greater than the sum of its parts, and this is a lesson that should be learned and influences through facet is examples of holistic management.

Communities that operate sewage treatment plants while pursuing partnerships with clean energy producers to use wastewater to fertilize algae and other biofuel crops. The crops, in turn, soak up nutrients and purify wastewater, significantly reducing pumping and treatment costs. Climate change and water scarcity are producing the most dramatic consequences in developing regions, such as northwest India and Sub-Saharan Africa. One proposed solution is to transfer water conservation technologies to these dry areas. Doing so is tricky because economies are weak and there are gaps in skills that often compel government and business authorities to impose these changes on local citizens.

Animal shelters are playing a vital role in caring for stray, abandoned, and injured animals. They provide a safe and temporary home for these animals and work to find them permanent homes through adoption programs.

NORTH KOREA FINISHED ITS FINAL PREPARATIONS FOR THE OLYMPIC GAMES

The North Korean Prime Minister announced in a statement to private TV channels that the final preparations for the Olympic games to be held this summer have been completed. She explained that many people, especially from the USA, have already booked the hotels and expressed that they are very pleased.
